

How to Append to a Variable with Preexisting Content

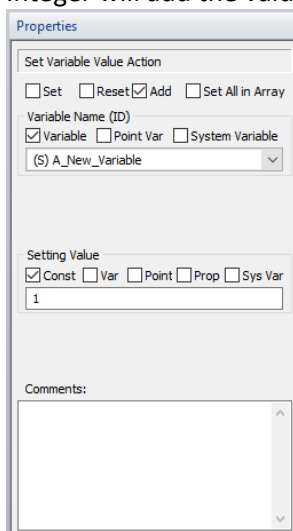

1. Create a String variable

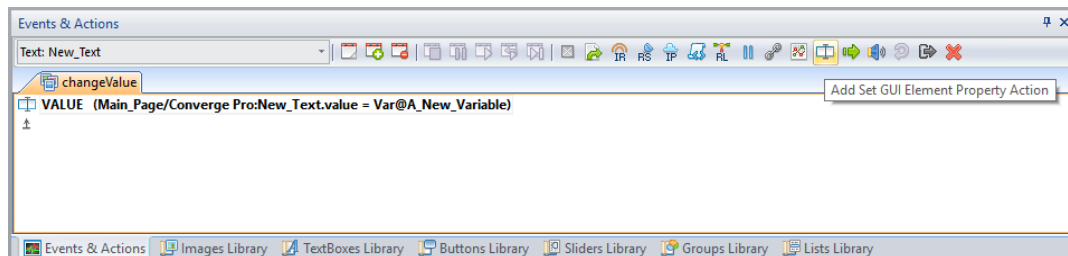

2. Add a Set Variable Value Action to your desired button or other GUI element

3. Check the "Add" box to append to the variable. (Note: you must append to a String variable. Appending to an Integer will add the values together like 2+2=4)

4. Add a *Set GUI Element Property Action* to the variable to update the text whenever the variable value is changed

Below is an example from our ClearOne module. When the Number 1 Key is pressed, "1" gets appended to the String variable "Converge_Selected_Dialer_Number"
